Done Censoring Google Maps Uncensor Google Maps Censoring Google Maps Censoring Google Maps Online censoring is an on-going problem that has been developing with the internet and the advent of smart phones as they become more and more prevalent in our everyday lives. People are starting to censor search results that are relevant to them and censoring at a more subtle level on the mobile app Google Maps. While the app does have a clean map, which doesn't have the data restriction shown on the desktop version of Google Maps, it does seem to censor the data and not show certain places that would be relevant to certain events. Anyone who has traveled before knows the "difficulty" of going somewhere that isn't in your bookmarks and is simply not on your mobile or desktop Google Maps. This map, created by actual censoring of the Google Maps app, captures this very problem. This is just one example of how it is being censored, as the best part of Google Maps, in my opinion, is the ability to search for any location and then have an answer to every single question you have. My opinion is that when a mobile app censors information on a search, that information should be available to the user, not censored by the user. People are already filtering their search results for them, why not censor in the app itself? Many people may not realize that there are two types of data that exist in Google Maps. The first type is what you see on the map and the second type is all the associated data. These data items are not searchable and are available only through the direct location button on the app. Censoring maps and eliminating data is not an easy problem to deal with. Having all the data available and searchable to the public would be a great help to the average user. Censoring this data should be a thing of the past. It is really funny when Google and Apple both show data from their map, as both apps use very similar maps and it is a common theme, the people who are dedicated to censoring information should be forced to read and understand the nature of information
