Peripheral Nerve Sheath Tumor (MPNST). Malignant peripheral nerve sheath tumor (MPNST) is a rare variant of soft tissue sarcoma. When present at locations with challenging anatomy (e.g., extremities and retroperitoneum), the therapeutic options are limited and most commonly include

surgery, chemotherapy, and/or radiotherapy. In this case, a patient with recurrent MPNST in the setting of locally advanced soft tissue sarcoma was treated with systemic intravenous hematoporphyrin, an oral chemotherapy agent approved for treatment of low-grade MPNST. After 9 months of

therapy, the patient had regression of his lesion, a significant reduction in pain, and stable disease. This case supports the use of hematoporphyrin in the treatment of refractory MPNST.Lethal interactions of several drugs with the dimeric iron-nitrosy 77a5ca646e
