Download: Video What it is: An index of badass superpowers with a bit of discussion of what makes them badass. The rules: Each superpower must be badass by being a unique, major-league superpower with no parenthetical backup Must be applicable to modern western civilization Each superpower must have a different mechanic to use to activate Must have no more than three words for the superpower to activate (or to be used on a regular basis) If it has more than three words, it is no longer badass Must be a superpower that you can use for a while without it taking more than a few seconds Can have at most five words Must be a super-overpowered-super-super-super-super-fast, I-can-do-anything-my-superpower-wants thing And then some goodies: A non-algorithmically-generated list of superpowers, to prove that there are tons of badass superpowers out there in the world. It's mostly just fun names, but it'll give you some ideas. A non-algorithmically-generated list of rules for making badass superpowers, just for fun. A non-algorithmically-generated list of badass superpowers that I think should work, to show you how awesome this exercise can be.

Beginning Visual Basic

* Quickly connect programming to the basics of the Visual Basic language. * Eliminate the complexity of the command-line interface with a Windows graphical IDE that provides on-screen command syntax and documentation, a full-featured editor, code completion, syntax highlighting and more. * The sample projects make it easy to get started coding immediately. * The sample projects can be run directly from the instructor's course notes. * Progress is incrementally tracked as you complete the projects. * Easy-to-follow step-by-step tutorials demonstrate how to build programs in VB. Easier to understand than the kid's version! Basic language syntax and sample projects are all written at an advanced level for an intermediate Visual Basic programmer. Students will acquire the following programming skills by this course: * Basic syntax * Variables * Arrays * Events * Data types * Basic graphics * Functions * Importing modules * Structure and syntax of command statements * Collections * ArrayLists * If statements * Do/While loops * Control statements * Loops and subroutines * Userforms and GUIs * Events and Events Procedures * Data and Information Storage Keypoints: * Visual Basic is a complete programming language and environment * Visual Basic provides a powerful integrated development environment for creating Windows applications * Visual Basic is the most popular Windows development tool, used by software developers worldwide * The Visual Basic programming language is easy to learn * The Visual Basic IDE is friendly to novice programmers * Examples are used throughout the course to help you grasp the concepts being presented Prerequisites: * Any version of Windows * Familiarity with the Windows keyboard and the mouse * Basic knowledge of the Windows operating system Microsoft Office XP or Windows Vista (Optional) Most of the software programs created in Visual Basic are created as Windows applications. Because Visual Basic is a Windows programming language, you will need a copy of Windows. Software Requirement: * Windows XP or Windows Vista Installing the Visual Basic Tools: Visual Basic is a language integrated into the Visual Basic development environment. You cannot run Visual Basic programs without first installing a version of Visual Basic. The course includes a video that shows how to install Visual Basic. If you do not already have Visual Basic 6.0 or Visual Basic 7.0 installed on your PC, this course includes step 1d6a3396d6
