A: AddIn, it's just an interface to inject your logic into VS through various means. VS has a component called Tools.AddIn, you can inject your logic in there. The component "must" be registered, and you do that through the interface. If you want to see an example, look at the SDK addin template (Tools.cs) or in the Windows SDK. Here's how to register your addin: public class Tools { public static void Register() { // This code is added in the Windows SDK. // This code is required for addins to work. object missing = Type.Missing; // Register your logic here. } } A: In addition to what has been said, there are 2 special types of add-ins: Windows and so-called Console add-ins
