I want to remove it but I want to keep the first four lines. How can I remove the part after the 2nd line? This is my code: `awk 'NR==2{remove=1}/~"versions/370" report.xml A: Try this awk {print $0; if ($1 == "version") {remove=0} else {print}} NR==2{delete=1}/~"versions/370" SAN JOSE – San Jose Sharks (@SanJoseSharks)` General Manager Doug Wilson announced today that the club has recalled forward Chris Tierney (@ChrisTierney13) from the San Jose Barracuda (@sjbarracuda). Tierney, 22, skated in one game with the Sharks in 2017-18, earning his first career NHL point on February 24 at Vancouver. The forward spent the entire 2016-17 season with the San Jose Barracuda, registering 1-7-8 and 21 PIM in 49 games played and was named the team's most outstanding rookie. He led all Barracuda skaters in points and was the only rookie to score a point-per-game average during the team's run to the 2017 Western Conference Finals, where they fell in Game 7 of the best-of-seven series to eventual Stanley Cup champions Pittsburgh. He registered 23-44-67 and 84 PIM in 117 regular season games in his four years with the Barracuda. The forward has skated in 93 career regular season games with the Barracuda, registering 11-34-45, 59 PIM, and a +8 plus/minus rating. He has added 1-3-4 in 12 postseason contests. He has also appeared in two career AHL Calder Cup Playoffs contests. San Jose's next home game is February 24 vs. the Vegas Golden Knights (5:00 p.m. PT). For the latest news, visit Sharks.com. A: You can use the `sqrt()` function to verify if a number is a square. This will return 1 if the number is a square, otherwise it returns 0. The electric security industry has been growing in popularity ever since the Sony PlayStation 3 was hacked into by the hacker group “Anonymous.” This allowed the hacker group to take over various gaming networks, defacing and altering data on the PlayStation Network. By changing the rendering parameters in a 3D game engine, the hacker group could create 3D models, and even manipulate them to create fake objects. This was an impressive feat and demonstrated to the world just how powerful 3D modeling and game engines are. In the years since, the popularity of 3D graphics, and 3D modeling and game engines has risen dramatically. There are currently over 10,000 3D modeling tools available. However, of the tens of thousands of 3D modeling tools, only a handful of modeling tools can be used for creating security monitoring systems, providing security teams with an advantage over conventional security monitoring systems. Through the use of computer vision and artificial intelligence, 3D models can be created for use in various domains. Much like video analytics, 3D modeling and game engines can create super-detailed 3D models that show the world around an individual or company. Companies and individuals have access to various levels of detail depending on how much they want to pay. For example, organizations such as NetDetect and PointNow offer 3D representations of their networks and firewalls for just \$29 per month. For example, a security professional can define an area as having 2 meters of walls and an area as having 8 meters of walls. The professional then defines where the camera is located with respect to the walls. Through a process of converting a measured point and distance into a 3D point and distance, the 3D model is generated. With current 3D modeling tools, it is possible to monitor various aspects of a company's network such as firewalls, servers, the amount of bandwidth on a network, traffic volumes, and even the location of a problem or error. This can be done at a variety of levels of detail. An organization can define that every 100 meters of the network needs to be monitored, or every server has to be monitored. Both of these tasks are possible with current 3D modeling tools. Another benefit to 3D f30f4ceada
