Meltwater-influenced ice sheet A meltwater-influenced ice sheet is an example of an ice sheet that is influenced by the presence of meltwater. Meltwater-influenced ice sheets are found in a number of mountainous regions, including some of the ice sheets of the Arctic and Antarctic. Advantages of meltwater-influenced ice sheets Advantages Meltwater-influenced ice sheets tend to be small when compared to ice sheets influenced by snow accumulation. Disadvantages In winter, meltwater is the most important part of the hydrologic cycle of many mountain regions. Due to their proximity to the oceans, meltwater-influenced ice sheets typically have high rates of flow through their ice sheet margins. Meltwater may also cause sheet thinning. In such cases, ice sheets may experience large-scale and potentially rapid shifts in their basal area. There is evidence that meltwater driven by strong winds may transport large amounts of ice. Interglacier flow On Earth, the term interglacier flow refers to the movement of ice between adjacent glacier advances during times when ice shelves are not present. Interglacier flow of ice is also the name of a minor tributary glacier of the Pine Island Glacier tongue in East Antarctica. This glacier has a typical crevasse density of about one every of its length. The crevasses are believed to form when ice is loaded with hydrostatic pressure and fails to drain completely. References Category:Ice sheets Category:GlaciologyChanges in the distribution of anti-Kell blood group antigen following liver transplantation. Immunosuppressive therapy, dietary changes, and corticosteroids are known to interfere with the expression of the Kell blood group antigen. We studied the association between development of erythrocyte antibodies against the Kell blood group antigen in 55 adult liver transplant recipients undergoing a one-year follow-up examination. An antiglobulin-enhanced flow cytometric immunoassay was used to analyse the presence of anti-Kell autoantibodies
