The image below shows a layer and its settings. Here are a few tips on how to start with a new project using Photoshop: 1. Choose a new project name (which will hold the name of the project when you use File⇒New). 2. Click File and select New, and create a new Photoshop document. 3. Create a new image or open an existing one (Photoshop opens a project only with a newer version of Photoshop). 4. Choose File⇒Place to insert the image. Choose the Folder from the Insert menu and click the folder to open. 5. Choose the Photos Library, the Fotostock™ Library, or the OneDrive for Business™ Photo Library and insert an image, or choose it from your computer's image folder. 6. The image will appear in your document. Click Edit⇒Define a New Document Size. 7. Adjust the page size to a horizontal size (4:3) and set the resolution to 300 dots per inch (dpi). 8. Choose File⇒Save and save your project. There you have it. You've created your first Photoshop project. The next few steps explain how to easily add more layers to your design. Adding more layers It's common for graphic designers to create one large file (perhaps a background or format) and several separate smaller files. They each contain only the graphic elements for that specific part of the design. After they're all linked to the original file, the designer selects one of the smaller files and changes the text or colors. Then she starts over on the next one. A good graphic designer can create a finished design from this arrangement, but you can edit a picture and break it apart, as shown in the next steps. To add a new layer to an image that has been opened in Photoshop, follow these steps: 1. Click on the small image you want to work on. For the purposes of this exercise, work on the down-sized picture of the project shown in the left image in Figure 4-1. **Figure 4-1:** You can edit an image and then export it back to a larger file with a separate smaller image. 2. Click on the New Layer icon (it's the one that looks like a box with a dotted line inside) on the Layers palette at the bottom of your image and a

Read on for a guide to using Photoshop's brush, shape, and selection tools. This month's coverage takes a look at using the brush as well as some sample brush applications. A number of brushes are featured; you can find them in the Brush Gallery (F9). For more on brushes, check out the Photoshop Brushes series on How-To Geek. [Note: This month's cover image, from image editor and author Steve Rabinowitz, is also the title background for the article.] The Brush Tool The brush is used to apply color to an image, as well as make small adjustments and effects. To make an image pixel-perfect, use the Pen tool. The Pen tool is designed to make precise lines, shapes, and selections. It is a good tool for creating professional-looking graphics. Photoshop does not require you to use the Pen tool for every image, but for some things, like creating borders or applying gradients, it is a better choice than the Brush tool. Brushes come in two types: standard and calligraphic. Standard brushes are large and blocky. Calligraphic brushes are thin. In general, they are more suitable for different types of images, such as letters, decorative images and complex designs. To add a brush, choose File>New to open the Brush dialog box. Using the Brush Tool As you know, the Brush tool creates color on an image. You can use the Brush tool to create almost any type of image. Press F1 to see a glossary of definitions, and help with the brush interface. Double-click on any color in the palette to select that color. Alternatively, press the spacebar to select the color. You can use the Brush tool to create gradients and shading by painting on the image and then going to the Layer Styles options. You can make the gradient of any color from the Color panel, though Photoshop doesn't have a tool to make a gradiant from the colors under the Histogram panel. Another type of brush is the Paint Bucket brush, which can be used for filling in areas of an image. The Brush dialog box has a variety of brush options, including the following: Use the brush tool and click on a part of an image to paint; click again to deselect the brush. The Brush Style drop-down menu in the Brush dialog box lets you choose

The photosynthetic pathway of the facultative halophilic cyanobacterium, Gloeocapsa sp., is dependent on the presence of the thylakoid membrane system, which is known for the chloroplasts of green algae and plants. The photosynthetic pathway of the facultative halophilic cyanobacterium Gloeocapsa sp. was investigated. The fluorescence transients of isolated Gloeocapsa cyanobacterial cells showed similar patterns to those of plant and green algal thylakoid membranes. A chlorophyll a fluorescence decrease accompanied with an increase in the membrane-bound antenna size was observed upon transfer to low-light conditions, which is consistent with the general decrease in the capacity of antenna assembly in photosystem I after dark incubation. However, a high contribution of the intersystem electron transport was also observed during the dark incubation of Gloeocapsa, suggesting the presence of two photosystems. The absorption spectrum of the membranes was similar to that of plant and green algal thylakoid membranes, and the absorbing components were identified by spectral comparison as chlorophyll a and b. Besides, the protein composition of the Gloeocapsa membranes was similar to that of the thylakoid membranes of plants, green algae, and certain halophilic Archaea, suggesting a close evolutionary relationship of this cyanobacterium to the chloroplast lineage. Moreover, the membranes of Gloeocapsa were found to contain a membrane lipid similar to that of plant chloroplast

membranes.Geographic Differences in the Incidence and Mortality of Uveal Melanoma in the United States. To evaluate and compare the incidence and survival of uveal melanoma between US regions by using the Surveillance, Epidemiology, and End Results (SEER) Program. Data were extracted from the SEER registry, the largest US cancer registry. Incidence was obtained from 1973 to 2012 and mortality data were available from 1975 to 2012. Poisson regression was used to evaluate the incidence and Cox proportional hazard models were used to evaluate the survival of uveal melanoma, and the effect of geographic region was assessed using estimated differences in incidence and survival across regions. Incidence was highest in the Northeastern US, and survival rates were similar across all 5 US geographic regions. Compared with the Midwestern US, the incidence of uveal melanoma was higher in the Southeast and Northeastern US. Survival was the best in the Southeast US
