How to Use Photoshop Technically, the word "Photoshop" could mean an individual tool or a suite of toolset. For example, a standalone Photoshop may refer to the program specifically, while a Photoshop Elements program may be a Photoshop "environment." In general, the software suite is based around images that contain layers and includes a dozen or more different tools that can be used to modify various features of an image's appearance. All the tools are organized into categories to help users navigate them, and some tools can also be used individually. Adobe does provide preset layers that can be applied to an image to perform different tasks, such as combining layers, moving layers up and down the z-axis, and other similar tasks. The most obvious features of Photoshop are the various brushes and tools for drawing or modifying existing artwork. It also includes tools for creating imagery that are separate from the existing artwork. The programs can also be used to control hardware devices in the computer, making them a cross-platform utility that is easily used in most applications. Some of the Photoshop tools include:

- Image Adjust: Allows the user to adjust colors, brightness, and contrast.
- Artistic Layers: Uses vector shapes to create more customized artwork. A user can manually create the custom shapes using the Pen tool and then use the mouse to click each shape to drag it to a desired location on the canvas, on which they can then move it up or down on the z-axis with the Move tool.
- Adjustment Layers: Provides a way to adjust the standard appearance of the image.
- Layer Properties: Allows the user to move, scale, or delete the layer.
- Layer Styles: Provides ways to customize the appearance of the layer using presets, color options, and shapes.
- Layer Comps: Allows users to match layers one to another.
- Video/Photo Effects: Offers various tools and options for creating new types of imagery, such as animation, monochrome, and retouching effects.
- Texture Layers: Provides options for changing the appearance of the pixels in a raster layer. For example, they can be used to apply different types of textures to objects.
- Mask Layers: Provides a tool for making selections on a layer without affecting the rest of the layers on the canvas.
- Layer History: Enables the user to undo previous edits to a layer.

Q: Forming an array based on values in another array I have a single array called \$species, and it contains the following values: And I have a second array called \$variants: In \$species, I have 24 separate values from 0 to 22. I need to have an array within an array from the values of \$species that correspond to \$variants. In this example, the arrays would look like this: \$spriteset = array(); \$spriteset[] = array(0 => \$variants[0], 1 => \$variants[1], 2 => \$variants[2]); \$spriteset[] = array(3 => \$variants[3], 4 => \$variants[4], 5 => \$variants[5]); \$spriteset[] = array(6 => \$variants[6], 7 => \$variants[7], 8 => \$variants[8]); \$spriteset[] = array(9 => \$variants[9], 10 => \$variants[10], 11 => \$variants[11]); \$spriteset[] = array(12 => \$variants[12], 13 => \$variants[13], 14 => \$variants[14]); \$spriteset[] = array(15 => \$variants[15], 16 => \$variants[16], 17 => \$variants[17]); \$spriteset[] = array(18 => \$variants[18], 19 => \$variants[19], 20 => \$variants[20]); \$spriteset[] = array(21 => \$variants[21], 22 => \$variants[22]); \$species array: Array ( [0] => 0 [1] => 7 [2] => 12 [3] => 17 [4] => 22 ) \$variants array: Array ( [0] => Array ( [name] => "Tengu" [good] => 1 [form] => "Brute"
